#### 1.4 General

SportCruiser is a Light Sport Aircraft (LSA) designed and built in :

OFFICE: ROHÁČOVA 188/37, 130 00, PRAHA 3, CZECH REPUBLIC

PRODUCTION FACILITY:

NA ZÁHONECH Č.E. 212, KUNOVICE, 686 04, CZECH REPUBLIC

#### www.czechsportaircraft.com

based on FAA Light Sport Aircraft category according to ASTM Standards F2245, F2279 and F 2295.

This Pilot Operating Handbook has been prepared to provide pilots with information for the safe and efficient operation of SportCruiser. It also contains supplemental data supplied by the Aircraft Flight Training Supplement.

# 1.5 Warnings, cautions and notes

The following definitions apply to warnings, cautions and notes in the Pilot Operating Handbook.

#### WARNING

Means that the non-observation of the corresponding procedure leads to an immediate or important degradation of the flight safety i.e. to injury or death of persons.

#### CAUTION

Means that the non-observation of the corresponding procedure leads to a minor or possible long term degradation of the flight safety.

#### NOTE

Draws attention to any special item not directly related to safety but which is important or unusual.

Date of Issue: 04/2009

2.1 Airplane description	2-2
2.2 Engine	2-8
2.3 Propeller	2-10
2.4 Fuel system	2-10
2.5 Oil	2-11
2.6 Operating weights and loading	2-12

# 2. AIRPLANE AND SYSTEMS DESCRIPTION

This section provides description and operation of the aircraft and its systems.

# 2.1 Airplane description

SportCruiser is the airplane intended especially for recreational and cross-country flying, and non-aerobatics operation.

SportCruiser is a single-engine, all metal, low-wing monoplane of semimonocoque construction with two side-by-side seats. The airplane is equipped with a fixed tricycle undercarriage with castering nose wheel.

### Airplane dimensions

Wing span	28.90 [ft]	(8.81 [m])
Length	21.33 [ft]	(6.50 [m])
Height	7.78 [ft]	(2.37 [m])
Wing area	132.3 [sq ft]	$(12.3 [m^2])$
Wing loading	10 [lb/sq ft]	(49 [kg/m <sup>2</sup> ])
Cockpit width	46 [in]	(1.17 [m])

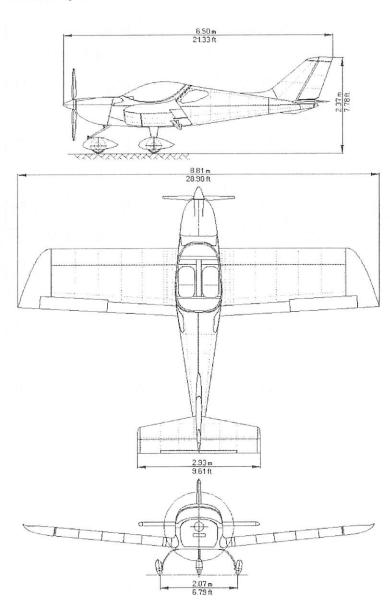

Date of Issue: 04/2009

# Aircraft layout

Date of Issue: 04/2009

#### Airframe

All-metal construction, stressed skin, single curvature metal skins riveted to stiffeners. Construction is of 6061-T6 aluminum sheet metal riveted to aluminum angles with Avex rivets. This high strength aluminum alloy construction provides long life and low maintenance costs thanks to its durability and corrosion resistance characteristics.

The wing has a high lift airfoil equipped with flaps.

# Control system

The plane is equipped with a dual stick control, the adjustable rudder pedals with pedal hydraulic brakes for easy ground control of the castering nose wheel.

The elevator and aileron trim are electrically actuated by buttons on the control stick. Wing flaps are electrically actuated by the rocker switch located on the middle panel.

#### Deflections:

Rudder deflections	.30° to each side
Elevator deflections	. + 28°/- 25°
Aileron deflections	. + 20°/- 15°
Flap deflections	.0° to 30°
Aileron trim deflections	. + 20°/- 20°
Elevator trim deflections	. + 22°/- 28°

# Landing gear

Tricycle landing gear with the castering nose wheel. Main landing gear uses two fiberglass spring elements.

Date of Issue: 04/2009

# Seats and safety harness

Side-by-side seating. Seat cushions are removable to make more easy cleaning and drying. Four point safety belts provided to each seat. Additional seat upholstery to raise the small pilot or move him forward can be the option.

#### NOTE

Prior to each flight, ensure that the seat belts are firmly secured to the airframe and that the belts are not damaged. The buckle to adjust to the central position on the body.

# Baggage compartment

The rear baggage compartment is located behind the seats. It may accommodate up to 40 [lb] (18 [kg]). This space is divide on two sections – baggage compartment A and B. Is not recommended give too heavy things into baggage compartment B.

The baggage may also be loaded into the baggage compartment inside each wing up to 44 [lb] (20 [kg]), in each wing locker.

Make sure that baggage does not exceed maximum allowable weight, and that the aircraft C.G. is within limits with loaded baggage.

All baggage must be properly secured.

# Canopy

Access to the cabin is from both sides. Make sure that the canopy is latched and mechanism is securely locked into position on both sides before operating the aircraft.

# Pitot - static system

Standard AVIATIK WA037383 pitot-static probe is located below the left wing. Pressure distribution to the instruments is through flexible plastic hoses. Keep the pitot head clean to ensure proper function of the system.

Date of Issue: 04/2009

# Cockpit

Actual picture, description and data for follow items

Instrument panel layout

and

Description of instrumentation and controls in the cockpit

and

Instruments and Avionics

and

Miscellaneous equipment

are shown in SECTION 10, Supplement No. 02

#### NOTE

For operating instructions refer to the documentation supplied with the instruments

# Minimum instruments and equipment list for VFR flights:

- Airspeed indicator
- Altimeter
- Compass (is not required by ASTM F 2245)
- Fuel quantity indicator
- Tachometer (RPM)
- Engine instruments as required by the engine manufacturer :
  - Oil temperature indicator
  - Oil pressure indicator
  - Cylinder head temperature indicator

# SportGruiser

# **Pilot Operating Handbook**

# 2.2 Engine

ROTAX 912 ULS engine 98.6 [hp] (73.5 [kW]) is installed in SportCruiser. Rotax 912 ULS is a 4-stroke, 4 cylinder, horizontally opposed, spark ignition engine with one central camshaft-push-rod-OHV. Liquid cooled cylinder heads, ram air cooled cylinders.

Dry sump forced lubrication. Dual contactless capacitor discharge ignition. The engine is fitted with an electric starter, AC generator and mechanical fuel pump. Prop drive via reduction gear with integrated shock absorber.

#### Coolant

#### Coolant type:

(refer to the ROTAX the Rotax Operator's manual section 10.1.2 Operating speeds and limits and section 10.2.1 Coolant, Rotax Installation manual section 12 Cooling system, Rotax Service Instruction SI-912-016)

In principle, 2 different types of coolant are permitted:

- Conventional coolant based on ethylene glycol
- Waterless coolant based on propylene glycol

#### WARNING

The coolant concentrate (propylen glycol) may not be mixed with conventional (glycol/water) coolant or with additives!

Non observance can lead to demages to the cooling system and engine.

#### CAUTION

Conventional glycol/water coolant reduce to apply the maximum permissible coolant exit temperature.

# Type of coolant used by aircrafts manufacturer:

- see Section 10 Supplement No. 02

# Coolant liquid volume:

(2.5 [litre])

Date of Issue: 04/2009

#### Throttle and Choke

Engine power is controlled by means of the THROTTLE lever with the CHOKE lever which are positioned in the middle channel between the seats side by side. Both levers are mechanically connected (by cable) to the flap on the carburetors. Springs are added to the throttle push rods to ensure that the engine will go to full power if the linkages fail.

### Carburetors preheating

Heated air streaming from a heat exchanger to the carburetors through the airbox. The control lever is installed on the middle panel.

# Heating

Heating consists of a heat exchanger on the exhaust manifold and actuator located on the instrument panel.

#### CAUTION

Incidents involving exhaust gases entering the heating or ventilation system may result in fatal accidents due to carbon monoxide poisoning of the aircraft occupants. A carbon monoxide detector is recommended.

# Electrical system

# **Battery**

The 12 [V] battery is mounted on the front side of forward bulkhead.

#### Master switch

Master switch connects the electrical system to the 12 [V] battery.

#### NOTE

Ignition system is independent on the power source and will operate even with Master switch and/or breaker off.

Date of Issue: 04/2009

#### Ignition Switch

Ignition switch must be on "BOTH" position to operate the engine. For safety remove the key when engine is not running.

#### NOTE

All switches or engine controls are "up" or "push forward" for operation, except the choke, cabin heating and carburetor preheat, which is "Pull" for "On". Optional equipment, switches and/or circuit breakers are subject to change or installed as requested. See Aircraft Equipment List and Instrument panel layout and Description of equipment and controls in the cockpit.

# 2.3 Propeller

Standard WOODCOMP KLASSIC 170/3/R three composite blade in ground adjustable propeller is installed.

#### NOTE

For technical data refer to documentation supplied by the propeller manufacturer

# 2.4 Fuel system

Each tank is equipped with a vent outlet and finger screen filter.

Drain valve located in the lowest point of the each tank and on the bottom edge of the bulkhead, on the gascollator.

Main fuel selector valve is on the central console in the cockpit.

The electric fuel pump is located on bulkhead.

#### CAUTION

Do not overfill the tanks to avoid fuel overflow through venting tubes.

Date of Issue: 04/2009

### Recommended fuel type:

(refer to the ROTAX Operator's manual section 10.2.2 Fuel, Rotax Service Instruction SI-912-016)

#### MOGAS

European standard

- min. RON 95, EN 228 Super, EN 228 Super plus

US standard

- ASTM D4814

Canadian standard

- min. AKI 91, CAN/CGSB-3.5 Quality 3

#### **AVGAS**

US standard

- AVGAS 100 LL (ASTM D910)

AVGAS 100 LL places greater stress on the valve seats due to its high lead content and forms increased deposits in the combustion chamber and lead sediments in the oil system. Thus it should only be used in case of problems with vapor lock or when other types of gasoline are unavailable.

#### Fuel volume:

Wing fuel tank volume	2x15.06 [US gal]	(2x57 [litre])
Unusable fuel quantity	/2x0.13 [US gal]	(2x0.5 [litre])

### 2.5 Oil

# Oil type:

(refer to the Rotax Operator's manual section 10.2.3 Lubricants, Rotax Service Instruction SI-912-016)

Motorcycle 4-stroke engine oil of registered brand with gear additives. Use only oil with API classification "SG" or higher! Use of multi-grade no mineral oils is recommended.

# Type of oil used by aircrafts manufacturer:

- see Section 10 Supplement No. 02

#### Oil volume:

Minimum	0.87	[US gal]	(3.3 [litre])
Maximum	1.0	[US gal]	(3.8 [litre])

Date of Issue: 04/2009

# 2.6 Operating weights and loading

Empty weight (standard equipment)760 [lb]	(345 [kg])
NOTE Actual empty weight is shown in Section 10 Suppleme	ent No. 02
LSA Max. take-off weight	(600 [kg])
Max landing weight	(600 [kg])
Max. weight of fuel	(82 [kg])
Max. baggage weight in rear fuselage40 [lb]	(18 [kg])
Max. baggage weight in each wing locker 44 [lb]	(20 [kg])

#### WARNING

Do not exceed maximum take-off weight 1 320 [lb] (600 [kg])!

Number of seats	. 2		
Minimum crew	1 pilot on th	e le	ft seat
Minimum crew weight	95 [lb]	(43	[kg])
Maximum crew weight	see Section	10	Supplement No. 02

# **SECTION 3**

# 3. OPERATING LIMITATIONS

3.1	Stalling speeds	3-2
3.2	Flap extended speed range	3-2
3.3	Maximum maneuvering speed	3-2

# 3.2 Flap extended speed range - V<sub>S0</sub> to V<sub>FE</sub>

Flap operating range (IAS):

32 - 75 [knot] (37 - 86 [mph])

# 3.3 Maximum maneuvering speed - VA

Maximum maneuvering speed (IAS):

88 [knot] (101 [mph])

# 3.4 Never exceed speed - V<sub>NF</sub>

Never exceed speed (IAS):

138 [knot] (158 [mph])

# 3.5 Maximum structural cruising speed - V<sub>NO</sub>

Maximum structural cruising speed (IAS):

108 [knot] (124 [mph])

Date of Issue: 04/2009

# 3.6 Crosswind and wind limitation

### Demonstrated wind performance

Max. demonstrated head wind velocity	
for take-off and landing	24 [knot
Max. demonstrated cross wind velocity	
for take-off and landing	12 [knot

# 3.7 Service ceiling

Service ceiling	10 000	Ift1
Service ceiling	10 000	LIL

# 3.8 Load factor

Maximum positive limit load factor	+4	g
Maximum negative limit load factor	- 2	9

# 3.9 Prohibited maneuvers

#### WARNING

#### AEROBATICS AND INTENTIONAL SPINS ARE PROHIBITED!

Airplane Category: LSA

# The SportCruiser is approved for normal and below listed maneuvers:

- Steep turns not exceeding 60° bank
- Lazy eights
- Chandelles
- Stalls (except whip stalls)

Date of Issue: 04/2009

# 3.10 Engine operating speeds and limits

Engir	ie Model:	ROTAX 912 ULS
Engir	e Manufacturer:	Bombardier-Rotax GMBH
Max Take-off:		98.6 hp (73.5 kW) at 5800 rpm (max. 5 min.)
Power	Max. Continuous:	92.5 hp (69 kW) at 5500 rpm
	Cruising:	71 hp (53 kW) at 4800 rpm
5	Max. Take-off:	5800 rpm (max. 5 min.)
Engine RPM	Max. Continuoust:	5500 rpm
ngin	Cruising:	4800 rpm
Ш	Idling:	1400 rpm (minimum)
nead ure:	Minimum:	122° F (50° C)

Date of Issue: 04/2009

# 3.11 Other limitations

- No smoking on board of the aircraft!
- There are permitted Day VFR flights
- Night VFR flights are permitted with installation of optional Night Lighting and Instruments Equipment and operation by an appropriately rated pilot.

WARNING
IFR FLIGHTS AND INTENTIONAL FLIGHTS UNDER ICING
CONDITIONS ARE PROHIBITED!

### Flight in rain

When flying in the rain, no additional steps are required. Aircraft qualities and performance are not substantially changed. However **VMC** must be maintained!

Intentionally left blank

# **SECTION 4**

# 4. WEIGHT AND BALANCE INFORMATION

4.1 Installed equipment list	4-2
4.2 Center of gravity range and determination	4-2
4.3 Permitted payload range	4-2

# 4. WEIGHT AND BALANCE INFORMATION

This section contains weight and balance records and the payload range for safe operating of SportCruiser aircraft.

Procedures for weighing the aircraft and the calculation method for establishing the permitted payload range are contained in FAA Aviation Advisory Circular AC.43.13 – 1B.

### Aircraft preparation for weighing

- remove all impurities from the aircraft as well as further undesirable objects.
- inflate tires to recommended operating pressure,
- drain fuel from fuel installation.
- add oil, hydraulic and cooling liquid up to the maximum specified value, retract wing flaps, close the canopy and other lids and covers, remove control surface blocking.

# 4.1 Installed equipment list

Actual Installed equipment list is shown in SECTION 10, Supplement No. 02.

# 4.2 Center of gravity (C.G.) range and determination

# Aircraft C.G. range:

# LSA category:

Max. take-off weight 1 320 [lb] (600 [kg])

# Aircraft C.G. determination:

Actual Weight and Balance reports are shown in SECTION 10, Supplement No. 02.

# 4.3 Permitted payload range

Actual Permitted payload range table is shown in SECTION 10, Supplement No. 02.

Date of Issue: 04/2009

# **SECTION 5**

# 5. PERFORMANCE

5.1 Take-off and landing distances	5-3
5.2 Rate of climb	5-3
5.3 Cruise speeds	5-4

Date of Issue: 04/2009

# 5. PERFORMANCE

The presented data has been computed from actual flight tests with the aircraft and engine in good conditions and using average piloting techniques.

If not stated otherwise, the performance stated in this section is valid for maximum take-off weight and under ISA conditions.

The performance shown in this section is valid for aircraft fitted with given ROTAX 912 ULS 98.6 [hp] (73.5 [kW]) engine and WOODCOMP KLASSIC 170/3/R propeller.

#### CAUTION

Airspeeds values are valid for standard AVIATIK WA037383 pitot-static probe.

# 5.1 Take-off and landing distances

### Take-off distances:

# **SECTION 6**

#### 6. EMERGENCY PROCEDURES

6.1 Engine failure	6-2
6.2 In-flight engine starting	6-3
6.3 Smoke and fire	6-3
6.4 Glide	6-5
6.5 Landing emergencies	6-5
6.6 Recovery from unintentional spin	6-7
6.7 Other emergencies	6-7

#### 6. EMERGENCY PROCEDURES

This section provides checklists and amplified procedures for coping with various emergencies that may occur. Emergencies caused by aircraft or engine malfunction are extremely rare if proper pre-flight inspections and maintenance are practiced.

However, should an emergency arise, the basic guidelines described in this section should be considered and applied as necessary to correct the problem.

#### CAUTION

Airspeeds values are valid for standard AVIATIK WA037383 pitot-static probe.

These emergency procedures are valid for standard WOODCOMP KLASSIC 170/3/R three composite blade in ground adjustable propeller.

### 6.1 Engine Failure

#### 6.1.1 Engine failure during take-off run

1. Throttle

- reduce to idle

2. Ignition switch

- switch off

3. Apply brakes

#### 6.1.2 Engine failure during take-off

1. Speed

- gliding at 60 [knot] (70 [mph])

2. Altitude

- below 150 [ft]: land in take-off direction

over 150 [ft]: choose a landing area

3. Wind

- find direction and velocity

Landing area

- choose free area without obstacles

5. Flaps

- extend as necessary

6. Fuel Selector

- close

o. Fuel Selector

- switch off

7. Ignition switch8. Safety harness

- tighten

Master switch

- switch off before landing

10. Land

Date of Issue: 04/2009

#### 6.1.3 Engine failure in flight

1. Push control stick forward

Speed - gliding at 60 [knot] (70 [mph]))

3. Altitude - below 150 [ft]: land in take-off direction

- over 150 [ft]: choose a landing area

4. Wind - find direction and velocity

5. Landing area - choose free area without obstacles

6. Flaps - extend as necessary

7. Fuel Selector - close

8. Ignition switch - switch off

9. Safety harness - tighten

10. Master switch - switch off before landing

11. Land

### 6.2 In-flight Engine Starting

1. Switches - switch off unnecessary electrical equipment

2. Master switch - switch on

3. Fuel Selector - turn on (to tank with more quantity of fuel)

4. Throttle - idle

5. Electric pump - switch on

6. Ignition switch - hold activated to start the engine

7. After engine starting - electric pump - switch off

- other switches - switch on as necessary

#### 6.3 Smoke and Fire

#### 6.3.1 Fire on ground at engine starting

1. Fuel Selector - close

Throttle - full power

3. Ignition switch - switch off

4. Leave the airplane

5. Extinguish fire by fire extinguisher or call for a fire-brigade if you cannot do it.

Date of Issue: 04/2009

#### 6.3.2 Fire on ground with engine running

Heating - close

2. Fuel selector - close

Throttle - full power

4. Ignition switch - switch off

5. Leave the airplane

Extinguish fire by fire extinguisher or call for a fire-brigade if you cannot do it.

#### 6.3.3 Fire during take-off

1. Speed - 60 [knot] (70 [mph])

Heating - close
 Fuel Selector - close

4. Throttle - full power5. Ignition switch - switch off

6. Land, stop and leave the airplane

Extinguish fire by fire extinguisher or call for a fire-brigade if you cannot do it.

#### 6.3.4 Fire in flight

1. Heating - close

2. Fuel Selector - close

Throttle - full power
 Master switch - switch off

5. Ignition switch - switch off after the fuel in carburetors is

consumed and engine shut down

6. Choose of area - heading to the nearest airport or choose emergency landing area

7. Emergency landing - perform according to 6.5.1

8. Leave the airplane

9. Extinguish fire by yourself or call for a fire-brigade if you cannot do it.

#### NOTE

Estimated time to pump fuel out of carburetors is about 30 [sec].

#### WARNING

Do not attempt to re-start the engine!

#### 6.3.5 Fire in the cockpit

1. Master switch

- switch off

2. Heating

- close

3. Use the fire extinguisher (if installed)

#### 6.4 Glide

An example of the use of gliding is in the case of engine failure

1. Speed - recommended gliding speed 60 [knot] (70 [mph])

### 6.5 Landing Emergencies

#### 6.5.1 Emergency landing

Emergency landings are generally carried out in the case of engine failure and the engine cannot be re-started.

- 1. Speed adjust for optimum gliding 60 [knot] (70 [mph])
- 2. Trim
- adjust
- Safety harness
- tighten
- 4. Flaps
- extend as necessary
- COMM
- if installed then report your location if possible
- 6. Fuel Selector
- close
- Ignition switch
- switch off
- Master switch
- switch off
- Perform approach without steep turns and land on chosen landing area.

Date of Issue: 04/2009

#### 6.5.2 Precautionary landing

A precautionary landing is generally carried out in the cases where the pilot may be disorientated, the aircraft has no fuel reserve or possibly in bad weather conditions.

- 1. Choose landing area, determine wind direction
- 2. Report your intention to land and land area location if a COMM is installed in the airplane.
- Perform low-altitude passage into wind over the right-hand side of the chosen area with flaps extended as needed and thoroughly inspect the landing area.
- 4. Perform circle pattern.
- 5. Perform approach at increased idling with flaps fully extended.
- Reduce power to idle when flying over the runway threshold and touchdown at the very beginning of the chosen area.
- 7. After stopping the airplane switch off all switches, shut off the fuel selector, lock the airplane and seek for assistance.

#### NOTE

Watch the chosen area steadily during precautionary landing.

#### 6.5.3 Landing with a flat tire

- During landing keep the damaged wheel above ground as long as possible using the ailerons control
- 2. Maintain the direction on the landing roll out, applying rudder control.

#### 6.5.4 Landing with a defective landing gear.

- If the main landing gear is damaged, perform touch-down at the lowest practicable speed and if possible, maintain direction during landing run.
- If the nose wheel is damaged perform touch-down at the lowest practicable speed and hold the nose wheel above the ground by means of the elevator control as long as possible.

Date of Issue: 04/2009

### 6.6 Recovery from Unintentional Spin

WARNING Intentional spins are prohibited!

There is no an uncontrollable tendency of the airplane to enter into a spin provided the normal piloting techniques are used.

Unintentional spin recovery technique:

1. Throttle

- idle

2. Lateral control

- ailerons neutralized

3. Rudder pedals

full opposite rudder

4. Rudder pedals

neutralize rudder immediately when

rotation stops

5. Longitudinal control

neutralize or push forward and recovery dive.

### 6.7 Other Emergencies

#### 6.7.1 Vibration

If any forced aircraft vibrations appear, it is necessary:

- To set engine speed to such power rating where the vibrations are lowest.
- 2. To land on the nearest airfield or to perform a precautionary landing according to 6.5.2.

Date of Issue: 04/2009

#### 6.7.2 Carburetors icing

The carburetors icing shows itself through a decrease in engine power and an increase of engine temperatures.

To recover the engine power, the following procedure is recommended:

1. Carburetors heating - open

4. Leave the icing area - as soon as possible

2. Throttle

- set to 1/3 of power

3. Speed

- min. 76 [knot] (87 [mph])

5. Engine power

- increase gradually

If you fail to recover the engine power, land on the nearest airfield (*if possible*) or depending on the circumstances, perform a precautionary landing according to 6.5.2

#### NOTE

Use carburetors heating at long time descent and in area of possible carburetors icing.

Remember: Aircraft is approved to operate in VMC condition only!

Date of Issue: 04/2009

# **SECTION 7**

#### 7. NORMAL PROCEDURES

7.1 Preflight check	7-2
7.2 Engine starting	7-4
7.3 Taxiing	7-6
7.4 Normal take-off	7-6
7.5 Climb	7-7
7.6 Cruise	7-7
7.7 Descend	7-7
7.8 Approach	7-8
7.9 Normal landing	7-8
7.10 Short field take-off and landing	
procedures	7-9
7.11 Balked landing procedures	7-9
7.12 Airplane parking and tie-down	7-10

Date of Issue: 04/2009

### 7. NORMAL PROCEDURES

This section provides checklists and recommended procedures for normal operation of the aircraft.

#### CAUTION

Airspeeds values are valid for standard AVIATIK WA037383 pitot-static probe.

These emergency procedures are valid for standard WOODCOMP KLASSIC

170/3/R three composite blade in ground adjustable propeller.

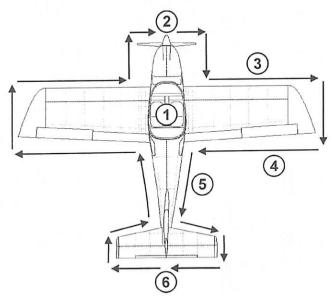

### 7.1 Pre-flight check

Carry out the pre-flight inspection every day prior to the first flight or after airplane assembly. Incomplete or careless inspection can cause an accident. Carry out the inspection following the instructions in the Inspection Check List.

#### NOTE

The word "condition" in the instructions means a visual inspection of surface for damage deformations, scratching, chafing, corrosion or other damages, which may lead to flight safety degradation.

The manufacturer recommends carrying out the pre-flight inspection as follows:

### **Inspection Check List**

1	-	Ignition	- OFF
	-	Master switch	- ON
	-	Fuel gauge ind.	- check fuel quantity
	-	Master switch	- OFF
	_	Avionics	- check condition
	-	Control system	- visual inspection, function, clearance,
			free movement up to stops
			<ul> <li>check wing flaps operation</li> </ul>
112	-	Canopy	<ul> <li>condition of attachment, cleanness</li> </ul>
100	-	Check cockpit for loose obje	cts
2	-	Engine cowling condition	11
	-	Propeller and spinner condit	
	-	Engine mount and exhaust r	
	-	Oil and coolant quantity che	
	_	Visual inspection of the fuel	and electrical system
	-	Fuel system draining	
	-	Other actions according to the	ne engine manual
3	-	Wing surface condition	
		Leading edge condition	
	_	Pitot head condition	
4	-	Wing tip	<ul> <li>surface condition, attachment</li> </ul>
	-	Aileron	<ul> <li>surface condition, attachment,</li> </ul>
			clearance,
			free movement
17118	-	Wing flap	<ul> <li>surface condition, attachment,</li> </ul>
			clearance
(5)	-	Landing gear	- wheel attachment, brakes,
		\\/	condition and pressure of tires
		Wing lower surface and fuse	
6		Vertical tail unit	- condition of surface, attachment, free
		Havimantal tailit	movement, rudder stops
	-	Horizontal tail unit	- condition of surface, attachment, free
	_		movement, elevator stops
	-	The check left side the fusel	age and wing is the same as right side

Date of Issue: 04/2009

#### WARNING

Physically check the fuel level before each takeoff to make sure you have sufficient fuel for the planned flight.

#### CAUTION

In case of long-term parking it is recommended to turn the engine several times (Ignition OFF!) by turning the propeller. Always handle by palm the blade area i.e. do not grasp only the blade edge. It will facilitate engine starting.

### 7.2 Engine starting

#### 7.2.1 Before engine starting

 Control system - free & correct movement

2. Canopy - clean Safety harness - tighten 4. Brakes - fully applied

7.2.2 Engine starting

> 1. Start the engine according to its manual procedure

2. Master switch - switch on 3. Fuel Selector - turn on (left or right fuel tank)

4. Choke (cold engine) - pull to open and gradually release after

instrument

engine start

5. Electrical pump - switch on

After engine starting

6. Ignition switch - hold activated to start the engine

 el. pump - switch off

 avionics - switch on

- other switches - switch on as necessary

- switch on

7.

#### CAUTION

The starter should be activated for a maximum of 10 [sec], followed by 2 [min] pause for engine cooling.

As soon as engine runs, adjust throttle to achieve smooth running at approx. 2500 [rpm]. Check the oil pressure, which should increase within 10 [sec]. Increase the engine speed after the oil pressure has reached 29 [psi] (2 [bar]) and is steady.

To avoid shock loading, start the engine with the throttle lever set for idling or 10 % open at maximum, then wait 3 [sec] to reach constant engine speed before new acceleration.

Only one magneto should be switched on (off) during ignition magneto check.

#### 7.2.3 Engine warm up, Engine check

Prior to engine check block the main wheels using chocks. Initially warm up the engine to 2000~[rpm] for approximately 2~[min], then continue to 2500~[rpm] till oil temperature reaches 122~[°F]~(50~[°C]). The warm up period depends on ambient air temperature.

Check both ignition circuits at 4000 [rpm] for Rotax 912 ULS. The engine speed drop during the time either magneto switched off should not over 300 [rpm]. The Max. engine speed drop difference between circuits L and R should be 120 [rpm].

#### NOTE

Only one magneto should be switched on (off) during ignition magneto check.

Set max. power for verification of max. speed with given propeller and engine parameters (temperatures and pressures).

Check acceleration from idling to max. power. If necessary, cool the engine at *idle* [rpm] before shutdown.

#### CAUTION

Tthe engine check should be performed with the aircraft heading upwind and not on a loose terrain (the propeller may suck grit which can damage the leading edges of blades).

Date of Issue: 04/2009

#### 7.3 Taxiing

Apply power and brakes as needed. Apply brakes to control movement on ground. Taxi carefully when wind velocity exceeds 20 [knot]. Hold the control stick in neutral position.

#### **Normal Take-off** 7.4

#### 741 Before take-off

1. Altimeter

2 Trim

Control system

4. Cockpit canopy

Safety harness

Fuel Selector 7. Ignition switch

8. Wing flaps

- set

- set neutral position

- check free movement

closed

- tighten

- turn on (left or right fuel tank)

- switched on (both magnetos)

extend as necessary

#### 7.4.2 Take-off

1. Brakes

2. Take-off power

3. Engine speed

4. Instruments within limits

Brakes 5.

Nose wheel unstick 6.

7. Airplane lift-off

8. Passing to climb

9. Wing flaps - apply to stop wheel rotation

- throttle fully forward

(max. 5800 [rpm] for max. 5 [min])

- check rpm - check

- release

- 32 [knot] (37 [mph]) - 42 [knot] (48 [mph])

- after reaching airspeed 65 [knot] (75 [mph])

 retract at safe altitude (max. airspeed for flaps using is

75 [knot], 86 [mph])

#### WARNING

The Take-off is prohibited if:

- The engine is running unsteadily
- The engine instruments values are beyond operational limits

The crosswind velocity exceeds permitted limits (see section 3.6)

Date of Issue: 04/2009

#### 7.5 Climb

1. Throttle

3. Trim

Instruments

- max. take-off power

(max. 5800 [rpm] for max. 5 [min])

- max. continue power (5500 [rpm])
2. Airspeed - v<sub>x</sub> = 60 [knot] (70 [mph])

 $-v_{v} = 65 [knot] (75 [mph])$ 

- trim the airplane

- oil temperature, oil pressure and

CHT within limits

#### CAUTION

If the cylinder head temperature or oil temperature and/or coolant temperature approaches or exceeds limits, reduce the climb angle to increase airspeed and possibly return within limits. If readings do not improve, troubleshoot causes other than high power setting at low airspeed.

- 7.5.1 Best angle of climb speed( $v_x$ ): 60 [knot] (70 [mph])
- 7.5.2 Best rate of climb speed( $v_y$ ): 65 [knot] (75 [mph])

#### 7.6 Cruise

Refer to Section 5, for recommended cruising figures

#### 7.7 Descend

Optimum glide speed

- 60 [knot] (70 [mph])

Date of Issue: 04/2009

# **SportGruiser**

#### **Pilot Operating Handbook**

#### 7.8 Approach

Approach speed

- 60 [knot] (70 [mph])

1. Throttle

- as necessary

2. Wing flaps

extend as necessary

3. Trim

- as necessary

#### CAUTION

It is not advisable to reduce the engine throttle control lever to minimum on final approach and when descending from very high altitude. In such cases the engine becomes under-cooled and a loss of power may occur.

Descent at increased idle (approximately 3000 [rpm]), speed between 60-75 [knot] (70-86 [mph]) and check that the engine instruments indicate values within permitted limits.

### 7.9 Normal landing

#### 7.9.1 Before landing

1. Throttle

- as necessary

2. Airspeed

- 60 [knot] (70 [mph])

3. Wing flaps

- extend as necessary

4. Trim

- as necessary

#### 7.9.2 Landing

1. Throttle

- idle

2. Touch-down on main wheels

3. Apply brakes (after the nose wheel touch-down) - as necessary

#### 7.9.3 After landing

1. Throttle

- engine rpm set as required for taxiing

2. Wing flaps

- retract

3. Trim

- set neutral position

Date of Issue: 04/2009

#### 7.9.4 Engine shut down

1. Throttle

- idle

Instruments

- engine instruments within limits

Switches

switch off except Instrument and Master

4. Ignition switch

- turn key to switch off

Instrument switch

Master switch

- switch off

- switch off

Fuel Selector

close

#### CAUTION

Rapid engine cooling should be avoided during operation. This happens above all during aircraft descent, taxiing, low engine rpm or at engine shutdown immediately after landing.

Under normal conditions the engine temperatures stabilize during descent, taxiing and at values suitable to stop engine by switching the ignition off. If necessary, cool the engine at idle [rpm] to stabilize the temperatures prior to engine shut down.

### 7.10 Short field take-off and landing procedures

None

### 7.11 Balked landing procedures

1. Throttle

max. take-off power

(max. 5800 [rpm] for max. 5 [min])

Passing to climb

after reaching 65 [knot] (75 [mph])

3. Trim

adjust as necessary

Wing flaps retract at safe altitude

(max. airspeed for flaps using is

75 [knot], 86 [mph])

5. Trim

adjust as necessary

Repeat circle pattern

#### 7.12 Aircraft parking and tie-down

1. Ignition switch

- OFF

2. Master switch

- OFF

3. Fuel selector

- close

4. Parking brake

- use it as necessary (if installed)

5. Canopy

- close, lock as necessary

6. Secure the airplane

#### NOTE

It is recommended to use parking brake (if installed) for short-time parking only, between flights during a flight day. After ending the flight day or at low temperatures of ambient air, do not use parking brake, but use the wheel chocks instead.

#### NOTE

Use anchor eyes on the wings and fuselage rear section to fix the airplane. Move control stick forward and fix it together with the rudder pedals. Make sure that the cockpit canopy is properly closed and locked. The anchoring before leaving the airplane is important if the airplane is not equipped with a parking brake.

Date of Issue: 04/2009

# **SECTION 8**

#### 8. AIRPLANE GROUND HANDLING AND SERVICING

8.1 Servicing fuel, oil and coolant	8-2
8.2 Towing and tie-down instructions	8-2
8.3 Assembly and Disassembly	8-4
8.4 Aircraft inspection periods	8-5
8.5 Aircraft alterations or repairs	8-5

# SportGruiser

#### **Pilot Operating Handbook**

# 8. AIRPLANE GROUND HANDLING AND SERVICING

This section contains factory-recommended procedures for proper ground handling and servicing of the airplane. It also identifies certain inspection and maintenance requirements, which must be followed if the airplane is to retain that new-plane performance and dependability.

### 8.1 Servicing fuel, oil and coolant

See appropriate chapters in the ROTAX engine Maintenance and Operator's manuals and SportCruiser Aircraft Maintenance and Inspection Procedures.

### 8.2 Towing and tie-down instructions

#### 8.2.1 Towing

To handle the airplane on ground use the Tow Bar, or the fuselage rear pushed down in the place of a bulkhead.

#### CAUTION

Avoid excessive pressure at the airplane airframe-especially at control surfaces. Keep all safety precautions, especially in the propeller area.

### 8.2.2 Mooring

The airplane should be moored when parked outside a hangar after the flight day. The mooring is necessary to protect the airplane against possible damage caused by wind and gusts.

For this reason the aircraft is equipped with mooring eyes located on the lower surfaces of the wings.

#### Mooring procedure:

- Check: Fuel Selector close, Master switch and other switches switched off, Ignition switch switched off.
- 2. Fix the hand control using e.g. safety harness

Date of Issue: 04/2009

- 3. Close air vent
- Close and lock canopy
- Moor the aircraft to the ground by means of a mooring rope passed through the mooring eyes located on the lower surfaces of the wings and below rear fuselage.

#### NOTE

In the case of long term parking, especially during winter, it is recommended to cover the cockpit canopy or possibly the whole aircraft by means of a suitable tarpaulin attached to the airframe.

#### 8.2.3 Parking

It is advisable to park the airplane inside a hangar or alternatively inside any other suitable space (garage) with stable temperature, good ventilation, low humidity and dust-free environment.

It is necessary to moor the airplane when it is parked outside a hangar. Also when parking for a long time, cover the cockpit canopy, possibly the whole airplane by means of a suitable tarpaulin.

#### 8.2.4 Jacking

Since the empty weight of this aircraft is relatively low, two people can lift the aircraft easily.

First of all prepare two suitable supports to support the aircraft.

It is possible to lift the aircraft by handling the following parts:

- By pushing the fuselage rear section down in the place of a bulkhead the fuselage front section may be raised and then supported under the firewall.
- By holding the fuselage rear section under a bulkhead the fuselage rear may be raised and then supported under that bulkhead.
- To lift up a wing, push from underneath that wing <u>only</u> at the main spar area. Do not lift up a wing by handling the wing tip.

Date of Issue: 04/2009

#### 8.2.5 Road transport

The aircraft may be transported after loading on a suitable car trailer. It is necessary to dismantle the wings before road transport. The aircraft and dismantled wings should be attached securely to protect these parts against possible damage.

#### 8.2.6 Cleaning and care

Use efficient cleaning detergents to clean the aircraft surface. Oil spots on the aircraft surface (except the canopy!) may be cleaned with petrol.

The canopy may only be cleaned by washing it with a sufficient quantity of lukewarm water and an adequate quantity of detergents. Use either a soft, clean cloth sponge or deerskin. Then use suitable polishers to clean the canopy.

#### CAUTION

Never clean the canopy under "dry" conditions and <u>never</u> use petrol or chemical solvents!

Upholstery and covers may be removed from the cockpit, brushed and eventually washed in lukewarm water with an adequate quantity of detergents. Dry the upholstery thoroughly before insertion into the cockpit.

#### CAUTION

In the case of long term parking, cover the canopy to protect the cockpit interior from direct sunshine.

### 8.3 Assembly and Disassembly

Refer to the SportCruiser Maintenance and Inspection Procedures and the SportCruiser Aircraft Assembly photo manual.

Date of Issue: 04/2009

### 8.4 Aircraft inspection periods

Periods of overall checks and contingent maintenance depends on the condition of the operation and on overall condition of the airplane.

Inspections and revisions should be carried out in the following periods, at least:

after the first

25 flight hours

after every

50 flight hours

after every

100 flight hours or at least annual inspection

Refer to the Sportcruiser aircraft Maintenance and Inspection Procedures for aircraft maintenance.

Refer to the Rotax engine Maintenance Manual for engine maintenance.

Maintain the propeller according to its manual.

All repairs and maintenance should be made in accordance with AC 43.13-1B.

### 8.5 Aircraft alterations or repairs

It is recommended to contact the airplane manufacturer prior to any alternations to the aircraft to ensure that the airworthiness of the aircraft is not violated. Always use only the original spare parts produced by the airplane (engine, propeller) manufacturer.

If the aircraft weight is affected by that alternation, a new weighing is necessary, then record the new empty weight into the Weight and Balance record / Permitted payload range and up-date the placard showing weights in the cockpit.

and markings	9-5

Date of Issue: 04/2009

### 9. REQUIRED PLACARDS AND MARKINGS

This section includes placards and instruments markings necessary for the safe operation of the aircraft.

#### The airplane must be placarded with:

- All circuit breakers
- All switches
- Choke: ON and OFF
- Elevator trim: Nose UP and Tail DOWN
- Flaps: UP and DOWN
- Maximum rear baggage weight: 40 lbs (18 kg)
- Maximum weight in each wing locker: 44 lbs (20 kg)
- Instruments
- Airspeed limitations
- · Canopy: Open Close
- Fuel capacity at filler necks: 57 litres / 15 US gal
   MOGAS RON 95 / AKI 91
- Fireproof Identification plate to be affixed to the aircraft in a prominent position near the main point of entrance to the aircraft (plate must show required information)

#### CAUTION

Airspeeds values are valid for standard AVIATIK WA037383 pitot-static probe.

### 9.1 Airspeed indicator range markings

Marking	IAS value or range		Significance	
knot mph		mph	Oignineance	
White arc	32-75	37-86	Flap Operating Range.	
Green arc	39-108	45-124	Normal Operating Range.	
Yellow arc	108-138	124-158	Maneuvers must be conducted with caution and only in smooth air.	
Red line	138	158	Maximum speed for all operations.	

### 9.2 Engine instruments markings

Rotax 912ULS 98.6 [hp] (73.5 [kW])	Minimum Limit (red line)	Normal Operating Range (green arc)	Caution Range (yellow arc)	Maximum Range (red line)
Engine speed [RPM]	1400	1400-5500	5500-5800	5800
Oil Temperature	122 °F (50 °C)	194-230 °F (90-110 °C)	230-266 °F (110-130 °C)	266 °F (130 °C)
Exhaust Gas Temp. (EGT)	•	1472-1562 °F (800-850 °C)	1562-1616 °F (850-880 °C)	1616 °F (880 °C)
Cylinder head Temperature (CHT)	122 °F (50 °C)	167-230 °F (75-110 °C)	230-275 °F (110-135 °C)	275 °F (135 °C)
Oil Pressure	12 psi (0.8 bar)	29-73 psi (2-5 bar)	73-102 psi (5-7 bar)	102 psi (7 bar) cold engine starting
Fuel Pressure	2.2 psi (0.15 bar)	2.2-5.8 psi (0.15-0.4 bar)		5.8 psi (0.4 bar)

# SportGruiser Pilot Operating Handbook

## 10.2 Inserted Supplemets

## AIRCRAFT SPECIFICATION

Aircraft Serial Number :	09SC277	

Aircraft Registration number:

This Supplement must be contained in the Pilot Operating Handbook during operation of the airplane.

Information contained in this Supplement add or replace information from the basic Pilot Operating Handbook in the further mentioned parts only. Limitations, procedures and information not mentioned in this Supplement are contained in the basic Pilot Operating Handbook.

This Supplement adds information necessary for airplane operation with equipment installed in the airplane.

Date of Issue: 05/2009
